*BECOMING AN...*

## Informed Investor

Today's Topic:  
*Stock Charts*

One method of objectively analyzing a company's growth prospects is to review the company's stock chart. A stock chart is basically a historical picture that graphically displays stock price movement over time. It usually tracks the daily price movement of a stock, its closing price and the number of shares traded during the day. The number of shares of stocks traded daily is referred to as volume.

A chartist is an analyst who uses chart patterns to ascertain future stock price direction. However, it is important to understand that stock charts cannot predict future price movements. It is one of many tools investors can use to help them analyze a company's prospects.

The tracking of stocks daily allows you to con-

stantly monitor changing investor expectations from which a trend can be determined. A trend is the general direction of stock price movement up, down or sideways, over a period of time.

Consistent price movement, in a particular direction, for six or more months is called a primary trend.

Typically a stock chart tracks price and time. It consists of a vertical line that shows the price range during the trading day and a horizontal line marking the opening and closing price for that day.

In May, 1886, Coca-Cola was invented by Doctor John Pemberton, a pharmacist from Atlanta, Georgia. He concocted the Coca-Cola formula in a brass kettle in his backyard.

Coca-Cola inventor John Pemberton's bookkeeper, Frank Robinson, scripted "Coca-Cola" into the flowing letters which has become the famous logo of today.

In July 1985, "Coca-Cola" was the first soft drink enjoyed in outer space on the Space Shuttle Challenger. A special space can was developed.

The name of the flavor base included in the secret formula for 'Coca-Cola' is referred to as 7X. Only a few people know the secret formula for 'Coca-Cola'.
